

why we Use Code first rather than DBfirst?

We use Code First because it allows us to create and manage the database using C# classes and migrations. It makes database changes easier to track and apply without manually creating or modifying tables in SQL Server

Why we use Fluent API over than Data Annotations?

We use Fluent API because it provides more flexibility and control over entity and database mapping than Data Annotations. It allows us to configure relationships, properties, constraints, and other database settings in one place.
